

Client Needs

A major pharmaceutical company was at risk of non-compliance to child resistant packaging regulations for its upper respiratory drug. The packaging was a PVC/PVDC blister with Alu/tissue.

Challenges

Potential non-compliance is a consumer risk and can often lead to costly recalls. Adept Packaging was tasked with the objective to redesign the packaging to ensure compliance with child resistant standards.

Results

Verification of Redesign for child resistant packaging

20 production lines were upgraded and qualified to remove the risk of any packaging failures.

STEPS TAKEN BY ADEPT

- Developed a strategy for achieving compliance without increasing the business risk around current product
- Redeveloped the packaging including an adjustment of the knife edge on the peel and push feature
- Recognizing the child resistant performance is dependent on the elements of the packaging, e.g. the material grades, the manufacture process, and the sealing properties, Adept's experts conducted a thorough review of the capability of the entire redevelopment process
